

Welcome to Coinbase Onramp Demo App

Running the app

Install dependencies

```
npm install
```

For Android, you need a debug keystore
(required for app signing):

If debug.keystore doesn't exist in android/
app, create it:

```
cd android/app
```

```
keytool -genkey -v -keystore
```

```
debug.keystore -storepass android -alias
```

```
androiddebugkey -keypass android -keyalg
```

```
RSA -keysize 2048 -validity 10000
```

Default debug keystore credentials (for
development only):

Keystore password: android

Key alias: androiddebugkey

Key password: android

Note: This keystore is for development only. For production, you'll need to create a separate release keystore.

Start the app

```
npx expo start
```

Follow the output instructions to run the app on your device or simulator.

Onramp integration demo

Main integration point is in the Fund component.

Steps to integrate:

Register and get the projectId from the CDP portal

Assemble the Onramp URL with the

getOnrampBuyUrl function

Open the browser with the Onramp URL

Download the iOS app

You can also download this (iOS) app on your phone using TestFlight [here](#)
